Who's Paying

Who's Paying is a program that could help determine who will have to pay for everybody's food bill. For this program to work, the user must enter all the names as names followed by a comma and then space (name, name, name).

My Role

The Who's Paying program is an individual project I created back in the early Covid days. Therefore, I am the programmer of this project.

The Difficulties and How to Deal with It

Luckily, I face no difficulties during the creation process of this program.

The Output – How it Works

Firstly, the program will ask for the names.

```
Give me everybody's names, separated by a comma. 
```

Next, the program will select a random name based on the names given by the user.

```
Give me everybody's names, separated by a comma. Johnny, Amber, Nicholas
Amber is going to buy the meal today!
```
